

Google Slides Script: Clinic File Reminder App

Slide 1: Title Slide - **Title:** Clinic File Reminder App - **Subtitle:** A simple app to track when to shred old patient files - **Presented by:** [Your Name]

Slide 2: Project Purpose - Many clinics still use physical records - Legal rules say: shred 3 years after death or 7 years after last visit - This app helps clinics stay compliant

Slide 3: Who It Helps - Small medical clinics and offices - Staff who manage physical files - Not meant to delete electronic records

Slide 4: Main Features - View Active and Inactive patient tabs - Add new patients via form or CSV - Run daily or manual reminder checks - Write shredding reminders to file

Slide 5: Technology Stack - Python 3 - tkinter for GUI - SQLite for database - CSV support for uploads - Date/time logic using datetime & dateutil

Slide 6: How It Works - Overview 1. Start the app and open the GUI 2. Load patient data (manual or CSV) 3. Run reminder logic 4. Update patient status and generate alerts 5. Loop continues daily or as needed

Slide 7: The Reminder Logic - For each patient: - If deceased and 3+ years since death → Inactive - If alive and 7+ years since last visit → Inactive - Alert written to reminders_YYYYMMDD.txt - Record stays in database (not deleted)

Slide 8: Example Output - File: reminders_20250522.txt - Sample entry: - Alice Johnson — 7 years since last visit - Bob Smith — 3 years since death

Slide 9: Real Testing - Created fake patients with real timelines - Verified correct reminders generated - Confirmed automatic vs manual runs both work

Slide 10: Challenges I Faced - Date math: calculating exact years - Keeping the GUI simple and intuitive - Managing file imports and error handling

Slide 11: Possible Upgrades - Login and admin roles - Email reminder support - Charts showing shredding history - Barcode integration for files

Slide 12: Final Thoughts - Learned Python, GUI, and database skills - Solved a real-world compliance problem - Simple, effective, and expandable tool

Slide 13: Official Project Timeline

Phase 1: Original Concept & Idea Formation

- Identified a real-world need: track paper file shredding timelines - Designed rules: 3+ years after death OR 7+ years after last visit

Phase 2: Week 1 – Core Logic & Reminders

- Wrote `shredder.py` and `midnight_check.py` - Created sample data and tested file output - Confirmed automatic reminder logic

Phase 3: Week 2 – Adding Patients & GUI

- Built GUI using tkinter with tabs and buttons - Enabled CSV upload + form input - Verified Active/Inactive patient display

Phase 4: Week 3 – Polish & Testing

- Improved GUI design - Handled exceptions and refined logic - Ran final tests for real-world cases

Key Changes Table: | Original Idea | Final Version | |-----|-----| | CLI script | Full GUI app | | Manual checks | Automated daily check | | Static list | CSV/form-based input | | On-screen alerts | `.txt` reminder logs |

Slide 14: Thank You - Ready for your questions! - [Contact info / class info / project link if needed]

Live Demo Cheat Sheet – Clinic File Reminder App

Clinic File Reminder App Timeline Graphic

1. Open the App - Run `gui_app.py` - GUI opens with "Active" and "Inactive" patient tabs

2. Add a Patient - Click "Add Patient" - Enter: - Name - Last Visit (YYYY-MM-DD) - Death Date (optional) - Click Submit

3. Upload CSV (Optional) - Use Upload button to import a batch of patients

4. Run Reminder Check - Click "Reminder Check" - App reviews each patient: - 3+ years since death → mark Inactive - 7+ years since last visit → mark Inactive

5. Show Reminder File - Open reminders_YYYYMMDD.txt - Example: "John Smith — 7 years since last visit"

6. View Inactive Tab - Switched patient now shown as Inactive - Database is updated but data is never deleted

7. Wrap-Up - "Simple tool, real-world value, fully functional."
